Integration can be direct animals above fish ponds indirect wastes of animals are used in the ponds as manure parallel rice-cum-fish or sequential fish production between crops. Carp produced in this way are generally more fatty, especially when the protein production natural food of the pond is not sufficient and the starch-based complementary feeding becomes predominant.

Several of these can be placed side by side on large outlets Fig. The factors to be considered in selecting sites for pens and cages in freshwater, brackish water, and marine environments are shown in Table Other - raceways, silos, tanks.

With this method, which is rather time-consuming and labour-intensive, see weight of this food should be discounted from the measured body weight. Harvesting procedures vary with the culture method.
