For some reason, developers want to insist paging is a function of the database and should be isolated to the data access layer. How are you instantiating the control VM's in that setup? This ebook covers what MVVM is and how to use it in practice, how to solve issues when applying this pattern and how to take advantage from it.

In the App object, it looks like this: . Why not just drive it out the way it works and leave it at that - what is the advantage you hope to gain from applying MVVM to it? The control's VM then updates the control's bound fields.

This simple model just adds these into a stack panel, but we will be doing more. You'd better check <http://www.mvvmframework.com/>: Business logic is typically kept separate from the model, and encapsulated in other classes that act on the model.
